

## program 02

1. demonstrate array aggregate functions using Numpy
2. demonstrate aggregate function using pandas

### Numpy Aggregation functions

```
1 # Numpy Aggregation functions on Array
2
3 import numpy as np
4
5 a = np.array([10,18,12,3,9,6,15])
6 print("The given array is : ", a)
7 print()
8
9 minimum = np.min(a)
10 maximum = np.max(a)
11 sum = np.sum(a)
12 avg = np.mean(a)
13 median = np.median(a)
14 std = np.std(a)
15 var = np.var(a)
16 min_index = np.argmin(a)
17 max_index = np.argmax(a)
18
19 values = {
20     "Minimum" : minimum,
21     "Maximum" : maximum,
22     "Sum" : sum,
23     "Average" : avg,
24     "Median" : median,
25     "Standard Deviation" : std,
26     "Variance" : var,
27     "Minimum index" : min_index,
28     "Maximum index" : max_index
29 }
30
31 for key,value in values.items():
32     print(key,":",value)
```

 The given array is : [10 18 12 3 9 6 15]

Minimum : 3  
Maximum : 18  
Sum : 73  
Average : 10.428571428571429  
Median : 10.0  
Standard Deviation : 4.746642207381757  
Variance : 22.530612244897956  
Minimum index : 3  
Maximum index : 1

### pandas Aggregation Functions

```
1 # pandas aggregate functions
2
3 import pandas as pd
4
5 df = pd.DataFrame({
6     "Maths" : [70,85,95,100,89,99,69,56],
7     "Statistics" : [100,78,96,69,85,52,75,89],
8     "Accountancy" : [89,96,89,98,59,73,100,99],
9     "Gender" : ['M','F','F','M','M','F','M','M']
10 })
11 print(df)
12 print()
13 print("Statistical measures : \n",df.describe())
14 print()
15 print("Sum of each column : \n",df.sum())
16 print()
17 print("To print the information about the dataframe :")
18 print(df.info())
19 print()
```

```
20 print("Grouping based on genders : \n",df.groupby("Gender").sum())
21 print()
22 print("df agg() method : \n",df.drop('Gender',axis=1).agg(['sum','mean','std']))
```

	Maths	Statistics	Accountancy	Gender
0	70	100	89	M
1	85	78	96	F
2	95	96	89	F
3	100	69	98	M
4	89	85	59	M
5	99	52	73	F
6	69	75	100	M
7	56	89	99	M

Statistical measures :

	Maths	Statistics	Accountancy
count	8.000000	8.000000	8.000000
mean	82.875000	80.500000	87.875000
std	16.137246	15.556349	14.623245
min	56.000000	52.000000	59.000000
25%	69.750000	73.500000	85.000000
50%	87.000000	81.500000	92.500000
75%	96.000000	90.750000	98.250000
max	100.000000	100.000000	100.000000

Sum of each column :

Maths	663
Statistics	644
Accountancy	703
Gender	MFFMMFMM

dtype: object

To print the information about the dataframe :

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 8 entries, 0 to 7
Data columns (total 4 columns):
#   Column          Non-Null Count  Dtype
---  -
0   Maths           8 non-null     int64
1   Statistics       8 non-null     int64
2   Accountancy     8 non-null     int64
3   Gender          8 non-null     object
dtypes: int64(3), object(1)
memory usage: 384.0+ bytes
None
```

Grouping based on genders :

	Maths	Statistics	Accountancy
Gender			
F	279	226	258
M	384	418	445

df agg() method :

	Maths	Statistics	Accountancy
sum	663.000000	644.000000	703.000000
mean	82.875000	80.500000	87.875000
std	16.137246	15.556349	14.623245
